available transmission channels (WiFi, cellular, etc) for server offloading (resulting papers published in INFOCOM 2013, 2014, and TMC 2015).

- *Fuel-efficient routing and speed advisory*: We aim at providing, in addition to the shortest and fastest, the most fuel-efficient route, as well as optimal driving speed advisories, between any pair of source and destination points on the map. (resulting paper published in IEEE TMC 2016).

- **Semantic Quality-Aware Information Delivery under Resource Constraints**

Funded by U.S. Army Research Laboratory as part of the Network Science Collaborative Technology Alliance, in collaboration with University of Southern California, the City University of New York, Raytheon BBN Technologies, and U.S. Army Research Laboratory, this project aims at building algorithms and systems that are geared towards crowd-sensing under resource-limited post-disaster scenarios, and optimize network resource consumptions while serving multiple concurrent queries with timely requirements (resulting papers published in DCSS 2015 and RTSS 2015).

- **Resource-Efficient Data Classification in Distributed Sensing Systems**

This project aims at building a resource-efficient system to classify sensory data distributed over a large number of sensor nodes under stringent network resources. We focus on two aspects of the sensor network nodes: data reliability and data redundancy, where reliability implies the degree to which a sensor node contributes to the classification mission, and redundancy represents the information overlap among different sensor nodes. We formulate and solve an optimization problem that maximizes the reliability of sensory data while eliminating their redundancies under the constraint of network resources (resulting papers published in RTSS 2012 and 2014).

- **NDN: Named Data Networking**

Funded by NSF, in collaboration with 10 other Universities and PARC. NDN is a recently proposed next-generation networking framework design, which aims at basing addresses on data names instead of machine locations. We aim at taking advantage of the “named data” nature of the NDN network and putting focus on maximizing information coverage rather than just data throughput when designing communication mechanisms under resource constraints (resulting paper published in ICCCN 2013).

**Dartmouth College**

September 2009–June 2011

Advisor: Andrew T. Campbell

- **Large Scale Activity Recognition using Community Similarity Networks**

This work targets on building a mobile phone human activity recognition system that can accurately carry out the recognition tasks on diverse populations by exploiting crowd-sourced sensor data, incorporating inter-person similarity measurements, and automatically personalizing classifiers with data contributed from other similar users (resulting paper published in UBIComp 2011).

- **Bridging Consumer Neural-Headset with Mobile Platforms**

In this work, we build NeuroPhone, a mobile system that is driven by neural signals, using a newly available off-the-shelf neural headset, for hands-free, silent and effortless human-mobile interaction. We build an address book dialing app on iPhone, which natively runs a lightweight classifier that extracts and detects the P300 brain potential from the EEG signal wirelessly transmitted by the headset (resulting paper published in MOBIHELD 2010).

**University of Massachusetts at Amherst**

January 2008–May 2008

Advisor: Andrew McCallum

- **Resource-bounded Information Extraction**

This work aims to design a general framework for the task of extracting specific information “on demand” from a large corpus such as the Web under resource constraints. Given a database with missing or uncertain information, our system automatically formulates queries, issues

them to a search interface, selects a subset of the documents, extracts the required information from them, and fills the missing values in the original database (resulting paper published in PAKDD 2010).

## TEACHING

### University of Illinois at Urbana-Champaign

- **Teaching Assistant**  
CS 125: Introduction to Computer Science  
Basic Data Structure, Algorithm, OOP using Java

### Dartmouth College

- **Teaching Assistant**  
CS 23: Software Design and Implementation – or, how to be a hacker  
Linux Bash scripting, design and implementation using C: web search (data crawling, indexing, and querying), and embedded Linux environment distributed concurrent system (remote robot control system)
- **Teaching Assistant**  
CS 8: Problem Solving with Computer Science  
Functional programming, Haskell language
- **Teaching Assistant**  
CS 5: Introduction to Computer Science  
Basic Data Structure, OOP using Java
- **Teaching Assistant**  
CS 4: Concepts in Computing  
Overview of computing and computer science, basic programming using html/css/javascript, debugging, design

### University of Massachusetts at Amherst

- **Teaching Assistant**  
Math 300: Fundamental Concepts of Mathematics  
Discrete mathematics, number theory, logics, set theory, rigorous proofs
- **Teaching Assistant**  
CS 311: Introduction to Algorithms  
Basic algorithm design, analysis, and implementations, sorting, searching, string processing, graphs
